THERAPEUTIC ACRIDONE AND ACRIDINE COMPOUNDS

RELATED APPLICATION

This application claims priority to United States provisional patent application no. 60/216,624 filed 07 July 2001, the contents of which are incorporated herein by reference in their entirety.

TECHNICAL FIELD

This invention pertains generally to the field of telomerase inhibitors and antiproliferative agents, and more specifically to certain acridone and acridine compounds which inhibit telomerase and/or regulate cell proliferation. The present invention also pertains to pharmaceutical compositions comprising such compounds, and the use of such compounds and compositions, both *in vitro* and *in vivo*, to inhibit telomerase, to regulate cell proliferation, and in the treatment of proliferative conditions, such as cancer.

20

BACKGROUND

Mammalian cells are normally subject to tight controls regulating replication in order to maintain organ structure and function. Conversely, the disease of cancer is characterized by uncontrolled proliferation. Compromise of any of the steps involved in cell cycle regulation could be involved in escape from regulatory mechanisms and therefore lead to neoplasia. However, even if a cell escapes proliferation suppression, there are limitations to the number of replicative cycles it can progress through before safety mechanisms cause cell cycle shutdown, and this restriction is thought to be a component of the process of organismal aging. Although aging is a complex process, a major candidate for the molecular signal for replicative senescence is that of telomere shortening.

- 2 -

Telomeres are nucleoprotein structures at the ends of linear chromosomes consisting of DNA sequences arranged in tandemly repeated units which extend from less than 100 to several thousands of bases. In contrast to chromosome ends created by random breakage, telomeres are stable structures not prone to
5 degradation or fusion with other chromosome ends and are not subject to DNA repair mechanisms.

During each round of cellular replication, both strands of DNA separate and daughter strands are synthesized in a slightly different manner on the leading and
10 lagging strand. While the lead strand replicates in a continuous fashion using conventional DNA polymerase, the lagging strand replicates in a discontinuous fashion using Okazaki fragments. The gaps between individual Okazaki fragments are filled by the regular DNA polymerase. However, this sets the stage for a potential "end replication problem." This arises because Okazaki fragment priming
15 will not necessarily start at the very end of the DNA and because the RNA primer, once removed, would result in a portion of unreplicated 3'-DNA (an unrepaired 3'-overhang). This can lead to a loss of 50-200 base pairs with every round of somatic cell division, with eventual shortening of telomeres to a length that coincides with the activation of an antiproliferative mechanism termed "mortality
20 stage 1" (M1), and at this stage, senescence in somatic cells occurs. Thus, telomere shortening functions as a "mitotic clock" and limits division in somatic cells to about 50-70 times, thereby contributing to cell aging.

In some cells, due to various mechanisms, the M1 stage is bypassed and cells can
25 continue to divide until telomeres become critically shortened ("mortality stage 2," M2). At this M2 stage, in many immortalized cells, a specialized DNA polymerase called "telomerase" appears and utilizes its internal RNA template to synthesize the telomeric sequence and compensate for the loss of telomeric DNA due to incomplete replication. This prevents further shortening of telomeres, and the
30 resulting stabilization of their length contributes to immortalization.

Telomerase is not expressed, or if it is, its activity is repressed, in most normal mammalian somatic cells. Exceptions to this rule include male germ line cells and

- 3 -

some epithelial stem cells (e.g., as in the intestinal crypts, the basal layer of the epidermis, and within human hair follicles).

Nonetheless, both telomerase activity and shortened but stabilized telomeres have been detected in the majority of tumours examined (and in over 90% of all human
5 cancers examined), and consequently, telomeres and telomerase are recognized targets for anti-neoplastic (e.g., cancer) chemotherapy.

The absence of telomerase in most normal cells makes this enzyme a particularly attractive target, considering that its inhibition would probably cause minimal
10 damage to the whole patient. The fact that tumour cells have shorter telomeres and higher proliferation rates than normal replicative cell populations suggests that a therapeutic telomerase inhibitor may cause tumour cell death well before damage to regenerative tissues occurs, thereby minimizing undesirable side-effects.

15 For a more detailed discussion of telomeres and telomerase, and their role as anti-proliferative targets, see, for example, Sharma et al., 1997; Urquidi et al., 1998; Perry et al., 1998c; Autexier, 1999; and Neidle et al., 1999, and references therein.

A number of polycyclic compounds, including polycyclic acridines, anthraquinones,
20 and fluorenones have been shown to inhibit telomerase and/or to have anti-tumour effects *in vitro*. See, for example, Bostock-Smith et al., 1999; Gimenez-Arnau et al., 1998; Gimenez-Arnau et al., 1998; Hagan et al., 1997; Hagan et al., 1998; Harrison et al., 1999; Julino et al., 1998; Perry et al., 1998a, 1998b, 1999a, 1999b; Sun et al., 1997.

25 Harrison et al., 1999, describe certain 3,6-disubstituted acridines which are shown to inhibit telomerase, and to inhibit cell growth in certain ovarian carcinoma cell lines.

- 4 -

Read et al., April 2001, describe certain 3,6,9-trisubstituted acridines (see compounds 3 and 4 in Figure 1 therein), including **BR-ACO-19** and **BR-ACO-20** which are shown to have potent in vitro inhibitory activity against human telomerase.

5

Although many are known, there remains a great need for potent telomerase inhibitors and antitumour agents, particularly for such compounds which offer additional pharmacological advantages. For example, particularly preferred telomerase inhibitors are ones which are characterized by one or more of the

10 following properties:

(a) no inhibition of *Taq* polymerase at 10-50 μ M (in order to provide specificity and eliminate broad-spectrum polymerase inhibitors);

(b) cell free telomerase inhibition (at <1 μ M) at concentrations more than 5 to 10-fold less than for concentrations for acute cytotoxicity;

15 (c) shortening of telomere length in tumour cells at concentrations 5 to 10-fold less than concentrations for acute cytotoxicity;

(d) telomere shortening in human tumour xenografts; and,

(e) oral bioavailability.

- C₅₋₂₀aryl: The term "C₅₋₂₀aryl," as used herein, pertains to a monovalent moiety
30 obtained by removing a hydrogen atom from an aromatic ring atom of a C₅₋₂₀aromatic compound, said compound having one ring, or two or more rings (e.g., fused), and having from 5 to 20 ring atoms, and wherein at least one of said ring(s) is an aromatic ring. Preferably, each ring has from 5 to 7 ring atoms.

- 47 -

In this context, the prefixes (e.g., C₃₋₂₀, C₅₋₇, C₅₋₆, etc.) denote the number of ring atoms, or range of number of ring atoms, whether carbon atoms or heteroatoms. For example, the term "C₅₋₆aryl," as used herein, pertains to an aryl group having 5
5 or 6 ring atoms. Examples of groups of aryl groups include C₃₋₂₀aryl, C₅₋₇aryl, C₅₋₆aryl.

Alternatively, the ring atoms may include one or more heteroatoms, including but
20 not limited to oxygen, nitrogen, and sulfur, as in "heteroaryl groups." In this case, the group may conveniently be referred to as a "C₅₋₂₀heteroaryl" group, wherein "C₅₋₂₀" denotes ring atoms, whether carbon atoms or heteroatoms. Preferably, each ring has from 5 to 7 ring atoms, of which from 0 to 4 are ring heteroatoms.

Isomers, Salts, Solvates, Protected Forms, and Prodrugs

Certain compounds may exist in one or more particular geometric, optical, enantiomeric, diastereomeric, epimeric, stereoisomeric, tautomeric, conformational,
20 or anomeric forms, including but not limited to, cis- and trans-forms; E- and Z-forms; c-, t-, and r- forms; endo- and exo-forms; R-, S-, and meso-forms; D- and L-forms; d- and l-forms; (+) and (-) forms; keto-, enol-, and enolate-forms; syn- and anti-forms; synclinal- and anticlinal-forms; α - and β -forms; axial and equatorial forms; boat-, chair-, twist-, envelope-, and halfchair-forms; and combinations
25 thereof, hereinafter collectively referred to as "isomers" (or "isomeric forms").

Note that, except as discussed below for tautomeric forms, specifically excluded from the term "isomers," as used herein, are structural (or constitutional) isomers (i.e., isomers which differ in the connections between atoms rather than merely by
30 the position of atoms in space). For example, a reference to a methoxy group, -OCH₃, is not to be construed as a reference to its structural isomer, a hydroxymethyl group, -CH₂OH. Similarly, a reference to ortho-chlorophenyl is not to be construed as a reference to its structural isomer, meta-chlorophenyl.

- 59 -

However, a reference to a class of structures may well include structurally isomeric forms falling within that class (e.g., C₁₋₇alkyl includes n-propyl and iso-propyl; butyl includes n-, iso-, sec-, and tert-butyl; methoxyphenyl includes ortho-, meta-, and para-methoxyphenyl).

5

The above exclusion does not pertain to tautomeric forms, for example, keto-, enol-, and enolate-forms, as in, for example, the following tautomeric pairs: keto/enol (illustrated below), imine/enamine, amide/imino alcohol, amidine/amidine, nitroso/oxime, thioketone/enethiol, N-nitroso/hydroxyazo, and nitro/aci-nitro.

10

Note that specifically included in the term "isomer" are compounds with one or more isotopic substitutions. For example, H may be in any isotopic form, including ¹H, ²H (D), and ³H (T); C may be in any isotopic form, including ¹²C, ¹³C, and ¹⁴C; O may be in any isotopic form, including ¹⁶O and ¹⁸O; and the like.

15

Unless otherwise specified, a reference to a particular compound includes all such isomeric forms, including (wholly or partially) racemic and other mixtures thereof. Methods for the preparation (e.g., asymmetric synthesis) and separation (e.g., fractional crystallisation and chromatographic means) of such isomeric forms are either known in the art or are readily obtained by adapting the methods taught herein, or known methods, in a known manner.

20

Unless otherwise specified, a reference to a particular compound also includes ionic, salt, solvate, and protected forms of thereof, for example, as discussed below.

25

It may be convenient or desirable to prepare, purify, and/or handle a corresponding salt of the active compound, for example, a pharmaceutically-acceptable salt.

- 60 -

Examples of pharmaceutically acceptable salts are discussed in Berge et al., 1977, "Pharmaceutically Acceptable Salts," J. Pharm. Sci., Vol. 66, pp. 1-19.

For example, if the compound is anionic, or has a functional group which may be anionic (e.g., -COOH may be -COO^-), then a salt may be formed with a suitable cation. Examples of suitable inorganic cations include, but are not limited to, alkali metal ions such as Na^+ and K^+ , alkaline earth cations such as Ca^{2+} and Mg^{2+} , and other cations such as Al^{+3} . Examples of suitable organic cations include, but are not limited to, ammonium ion (i.e., NH_4^+) and substituted ammonium ions (e.g., NH_3R^+ , NH_2R_2^+ , NHR_3^+ , NR_4^+). Examples of some suitable substituted ammonium ions are those derived from: ethylamine, diethylamine, dicyclohexylamine, triethylamine, butylamine, ethylenediamine, ethanolamine, diethanolamine, piperazine, benzylamine, phenylbenzylamine, choline, meglumine, and tromethamine, as well as amino acids, such as lysine and arginine. An example of a common quaternary ammonium ion is $\text{N}(\text{CH}_3)_4^+$.

If the compound is cationic, or has a functional group which may be cationic (e.g., -NH_2 may be -NH_3^+), then a salt may be formed with a suitable anion. Examples of suitable inorganic anions include, but are not limited to, those derived from the following inorganic acids: hydrochloric, hydrobromic, hydroiodic, sulfuric, sulfurous, nitric, nitrous, phosphoric, and phosphorous. Examples of suitable organic anions include, but are not limited to, those derived from the following organic acids: acetic, propionic, succinic, glycolic, stearic, palmitic, lactic, malic, pantoic, tartaric, citric, gluconic, ascorbic, maleic, hydroxymaleic, phenylacetic, glutamic, aspartic, benzoic, cinnamic, pyruvic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, and valeric. Examples of suitable polymeric anions include, but are not limited to, those derived from the following polymeric acids: tannic acid, carboxymethyl cellulose.

It may be convenient or desirable to prepare, purify, and/or handle a corresponding solvate of the active compound. The term "solvate" is used herein in the conventional sense to refer to a complex of solute (e.g., active compound, salt of active compound) and solvent. If the solvent is water, the solvate may be

- 61 -

conveniently referred to as a hydrate, for example, a mono-hydrate, a di-hydrate, a tri-hydrate, etc.

It may be convenient or desirable to prepare, purify, and/or handle the active
5 compound in a chemically protected form. The term "chemically protected form,"
as used herein, pertains to a compound in which one or more reactive functional
groups are protected from undesirable chemical reactions, that is, are in the form of
a protected or protecting group (also known as a masked or masking group or a
blocked or blocking group). By protecting a reactive functional group, reactions
10 involving other unprotected reactive functional groups can be performed, without
affecting the protected group; the protecting group may be removed, usually in a
subsequent step, without substantially affecting the remainder of the molecule.
See, for example, Protective Groups in Organic Synthesis (T. Green and P. Wuts,
Wiley, 1991).

15 For example, a hydroxy group may be protected as an ether (-OR) or an ester (-
OC(=O)R), for example, as: a t-butyl ether; a benzyl, benzhydryl (diphenylmethyl),
or trityl (triphenylmethyl) ether; a trimethylsilyl or t-butyldimethylsilyl ether; or an
acetyl ester (-OC(=O)CH₃, -OAc).

20 For example, an aldehyde or ketone group may be protected as an acetal or ketal,
respectively, in which the carbonyl group (>C=O) is converted to a diether
(>C(OR)₂), by reaction with, for example, a primary alcohol. The aldehyde or
ketone group is readily regenerated by hydrolysis using a large excess of water in
25 the presence of acid.

For example, an amine group may be protected, for example, as an amide or a
urethane, for example, as: a methyl amide (-NHCO-CH₃); a benzyloxy amide
(-NHCO-OCH₂C₆H₅, -NH-Cbz); as a t-butoxy amide (-NHCO-OC(CH₃)₃, -NH-Boc);
30 a 2-biphenyl-2-propoxy amide (-NHCO-OC(CH₃)₂C₆H₄C₆H₅, -NH-Bpoc), as a
9-fluorenylmethoxy amide (-NH-Fmoc), as a 6-nitroveratryloxy amide (-NH-Nvoc),
as a 2-trimethylsilylethoxy amide (-NH-Teoc), as a 2,2,2-trichloroethoxy amide (-

- 62 -

NH-Troc), as an allyloxy amide (-NH-Alloc), as a 2(-phenylsulphonyl)ethyloxy amide (-NH-Psec); or, in suitable cases, as an N-oxide (>NO•).

For example, a carboxylic acid group may be protected as an ester for example, as:

5 an C₁₋₇alkyl ester (e.g., a methyl ester; a t-butyl ester); a C₁₋₇haloalkyl ester (e.g., a C₁₋₇trihaloalkyl ester); a triC₁₋₇alkylsilyl-C₁₋₇alkyl ester; or a C₅₋₂₀aryl-C₁₋₇alkyl ester (e.g., a benzyl ester; a nitrobenzyl ester); or as an amide, for example, as a methyl amide.

10 For example, a thiol group may be protected as a thioether (-SR), for example, as: a benzyl thioether; an acetamidomethyl ether (-S-CH₂NHC(=O)CH₃).

It may be convenient or desirable to prepare, purify, and/or handle the active compound in the form of a prodrug. The term "prodrug," as used herein, pertains to

15 a compound which, when metabolised (e.g., *in vivo*), yields the desired active compound. Typically, the prodrug is inactive, or less active than the active compound, but may provide advantageous handling, administration, or metabolic properties.

20 For example, some prodrugs are esters of the active compound (e.g., a physiologically acceptable metabolically labile ester). During metabolism, the ester group (-C(=O)OR) is cleaved to yield the active drug. Such esters may be formed by esterification, for example, of any of the carboxylic acid groups (-C(=O)OH) in the parent compound, with, where appropriate, prior protection of any other reactive

25 groups present in the parent compound, followed by deprotection if required.

Examples of such metabolically labile esters include those wherein R is C₁₋₇alkyl (e.g., -Me, -Et); C₁₋₇aminoalkyl (e.g., aminoethyl; 2-(N,N-diethylamino)ethyl; 2-(4-morpholino)ethyl); and acyloxy-C₁₋₇alkyl (e.g., acyloxymethyl; acyloxyethyl; e.g., pivaloyloxymethyl; acetoxymethyl; 1-acetoxyethyl; 1-(1-methoxy-1-

30 methyl)ethyl-carboxyloxyethyl; 1-(benzoyloxy)ethyl; isopropoxy-carboxyloxymethyl; 1-isopropoxy-carboxyloxyethyl; cyclohexyl-carboxyloxymethyl; 1-cyclohexyl-carboxyloxyethyl; cyclohexyloxy-carboxyloxymethyl; 1-cyclohexyloxy-

- 63 -

carbonyloxyethyl; (4-tetrahydropyranyloxy) carbonyloxymethyl; 1-(4-tetrahydropyranyloxy)carbonyloxyethyl; (4-tetrahydropyranyl)carbonyloxymethyl; and 1-(4-tetrahydropyranyl)carbonyloxyethyl).

5

Also, some prodrugs are activated enzymatically to yield the active compound, or a compound which, upon further chemical reaction, yields the active compound. For example, the prodrug may be a sugar derivative or other glycoside conjugate, or may be an amino acid ester derivative.

Uses

5

The present invention provides active compounds, specifically, active acridines and acridones, as described herein. The term "active," as used herein, pertains to compounds which are capable of inhibiting telomerase and/or of regulating cell proliferation.

10

One of ordinary skill in the art is readily able to determine whether or not a candidate compound inhibits telomerase activity. For example, one assay which may conveniently be used in order to assess the telomerase inhibition offered by a particular compound is described in the examples below.

15

Thus, the present invention provides active compounds which inhibit telomerase, as well as methods of inhibiting telomerase, comprising contacting a cell with an effective amount of an active compound, preferably in the form of a pharmaceutically acceptable composition. Such a method may be practised *in vitro* or *in vivo*.

20

The present invention further provides active compounds which regulate cell proliferation, as well as methods of regulating cell proliferation, comprising contacting a cell with an effective amount of an active compound, preferably in the form of a pharmaceutically acceptable composition. Such a method may be practised *in vitro* or *in vivo*.

25

For example, a sample of cells (e.g., from a tumour) may be grown *in vitro* and an active compound brought into contact with said cells, and the effect of the compound on those cells observed. As examples of "effect," the morphological status of the cells may be determined, or the expression levels of genes associated with cell cycle regulation determined. Where the active compound is found to exert an influence on the cells, this may be used as a prognostic or diagnostic marker of

30

- 66 -

the efficacy of the compound in methods of treating a patient carrying cells of the same cellular type.

One of ordinary skill in the art is readily able to determine whether or not a
5 candidate compound regulates cell proliferation for any particular cell line. For example, one assay which may conveniently be used to assess the activity offered by a particular compound is described in the examples below.

The present invention further provides active compounds which are antiproliferative
10 agents. The term "antiproliferative agent" as used herein, pertain to a compound which treats a proliferative condition (i.e., a compound which is useful in the treatment of a proliferative condition).

One of ordinary skill in the art is readily able to determine whether or not a
15 candidate compound treats a proliferative condition for any particular cell line. For example, one assay which may conveniently be used to assess the activity offered by a particular compound is described in the examples below.

The terms "cell proliferation," "proliferative condition," "proliferative disorder," and
20 "proliferative disease," are used interchangeably herein and pertain to an unwanted or uncontrolled cellular proliferation of excessive or abnormal cells which is undesired, such as, neoplastic or hyperplastic growth, whether in vitro or in vivo. Examples of proliferative conditions include, but are not limited to, benign, pre-malignant, and malignant cellular proliferation, including but not limited to,
25 neoplasms and tumours (e.g., histocytoma, glioma, astrocyoma, osteoma), cancers (e.g., ovarian carcinoma, breast carinoma, bowel cancer, colon cancer, renal cancer, lung cancer, small cell lung cancer, testicular cancer, prostate cancer, sarcoma, osteosarcoma, Kaposi's sarcoma, melanoma), leukemias, psoriasis, bone diseases, fibroproliferative disorders (e.g., of connective tissues), and
30 atherosclerosis. Any type of cell may be treated, including but not limited to, colon, kidney (renal), breast (mammary), lung, ovarian, liver (hepatic), pancreas, skin, and brain.

- 67 -

Antiproliferative compounds of the present invention have application in the treatment of cancer, and so the present invention further provides anticancer agents. The term "anticancer agent" as used herein, pertains to a compound which treats a cancer (i.e., a compound which is useful in the treatment of a cancer). The
5 anti-cancer effect may arise through one or more mechanisms, including but not limited to, the regulation of cell proliferation, the inhibition of angiogenesis (the formation of new blood vessels), the inhibition of metastasis (the spread of a tumour from its origin), the inhibition of invasion (the spread of tumour cells into neighbouring normal structures), or the promotion of apoptosis (programmed cell
10 death).

The invention further provides active compounds for use in a method of treatment of the human or animal body, for example, in the treatment of a proliferative condition, for example cancer. Such a method may comprise administering to such
15 a subject a therapeutically-effective amount of an active compound, preferably in the form of a pharmaceutical composition.

The term "treatment," as used herein in the context of treating a condition, pertains generally to treatment and therapy, whether of a human or an animal (e.g., in
20 veterinary applications), in which some desired therapeutic effect is achieved, for example, the inhibition of the progress of the condition, and includes a reduction in the rate of progress, a halt in the rate of progress, amelioration of the condition, and cure of the condition. Treatment as a prophylactic measure (i.e., prophylaxis) is also included.

25 The term "therapeutically-effective amount," as used herein, pertains to that amount of an active compound, or a material, composition or dosage from comprising an active compound, which is effective for producing some desired therapeutic effect, commensurate with a reasonable benefit/risk ratio.

30 The term "treatment" includes combination treatments and therapies, in which two or more treatments or therapies are combined, for example, sequentially or simultaneously. Examples of treatments and therapies include, but are not limited

- 68 -

to, chemotherapy (the administration of active agents, including, e.g., drugs, antibodies (e.g., as in immunotherapy), prodrugs (e.g., as in photodynamic therapy, GDEPT, ADEPT, etc.); surgery; radiation therapy; and gene therapy.

- 5 The invention further provides the use of an active compound for the manufacture of a medicament, for example, for the treatment of a proliferative condition.

The invention further provides a method of treatment of the human or animal body, the method comprising administering to a subject in need of treatment a
10 therapeutically-effective amount of an active compound, preferably in the form of a pharmaceutical composition.

Active compounds may also be used as cell culture additives to inhibit telomerase, for example, in order to regulate cell proliferation *in vitro*.

15

Active compounds may also be used as part of an *in vitro* assay, for example, in order to determine whether a candidate host is likely to benefit from treatment with the compound in question.

- 20 Active compounds may also be used as a standard, for example, in an assay, in order to identify other active compounds, other telomerase inhibitors, other antiproliferative agents, etc.

Kits

25

One aspect of the invention pertains to a kit comprising (a) the active ingredient, preferably provided in a suitable container and/or with suitable packaging; and (b) instructions for use, for example, written instructions on how to administer the active compound.

30

The written instructions may also include a list of indications for which the active ingredient is a suitable treatment.

- 69 -

Administration

- The active compound or pharmaceutical composition comprising the active compound may be administered to a subject by any convenient route of administration, whether systemically/ peripherally or at the site of desired action, including but not limited to, oral (e.g. by ingestion); topical (including e.g., transdermal, intranasal, ocular, buccal, and sublingual); pulmonary (e.g., by inhalation or insufflation therapy using, e.g., an aerosol, e.g., through mouth or nose); rectal; vaginal; parenteral, for example, by injection, including subcutaneous, intradermal, intramuscular, intravenous, intraarterial, intracardiac, intrathecal, intraspinal, intracapsular, subcapsular, intraorbital, intraperitoneal, intratracheal, subcuticular, intraarticular, subarachnoid, and intrasternal; by implant of a depot, for example, subcutaneously or intramuscularly.
- The subject may be a eukaryote, an animal, a vertebrate animal, a mammal, a rodent (e.g., a guinea pig, a hamster, a rat, a mouse), murine (e.g., a mouse), canine (e.g., a dog), feline (e.g., a cat), equine (e.g., a horse), a primate, simian (e.g., a monkey or ape), a monkey (e.g., marmoset, baboon), an ape (e.g., gorilla, chimpanzee, orangutang, gibbon), or a human.

Formulations

- While it is possible for the active compound to be administered alone, it is preferable to present it as a pharmaceutical composition (e.g., formulation) comprising at least one active compound, as defined above, together with one or more pharmaceutically acceptable carriers, excipients, buffers, adjuvants, stabilisers, or other materials well known to those skilled in the art and optionally other therapeutic agents.
- Thus, the present invention further provides pharmaceutical compositions, as defined above, and methods of making a pharmaceutical composition comprising admixing at least one active compound, as defined above, together with one or

- 70 -

more pharmaceutically acceptable carriers, excipients, buffers, adjuvants, stabilisers, or other materials, as described herein.

The term "pharmaceutically acceptable" as used herein pertains to compounds,
5 materials, compositions, and/or dosage forms which are, within the scope of sound medical judgement, suitable for use in contact with the tissues of a subject (e.g., human) without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio. Each carrier, excipient, etc. must also be "acceptable" in the sense of being compatible with the
10 other ingredients of the formulation.

The formulations may conveniently be presented in unit dosage form and may be prepared by any methods well known in the art of pharmacy. Such methods include the step of bringing into association the active compound with the carrier
15 which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association the active compound with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product.

20 Formulations may be in the form of liquids, solutions, suspensions, emulsions, tablets, lozenges, granules, powders, capsules, cachets, pills, ampoules, suppositories, pessaries, ointments, gels, pastes, creams, sprays, foams, lotions, oils, boluses, electuaries, or aerosols.

25 Formulations suitable for oral administration (e.g., by ingestion) may be presented as discrete units such as capsules, cachets or tablets, each containing a predetermined amount of the active compound; as a powder or granules; as a solution or suspension in an aqueous or non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion; as a bolus; as an electuary; or as a
30 paste.

A tablet may be made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a

- 71 -

suitable machine the active compound in a free-flowing form such as a powder or granules, optionally mixed with a binder (e.g., povidone, gelatin, hydroxypropylmethyl cellulose), lubricant, inert diluent, preservative, disintegrant (e.g., sodium starch glycolate, cross-linked povidone, cross-linked sodium

5 carboxymethyl cellulose), surface-active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active compound therein using, for example, hydroxypropylmethyl cellulose in

10 varying proportions to provide the desired release profile. Tablets may optionally be provided with an enteric coating, to provide release in parts of the gut other than the stomach.

Formulations suitable for topical administration (e.g., transdermal, intranasal,

15 ocular, buccal, and sublingual) may be formulated as an ointment, cream, suspension, lotion, powder, solution, past, gel, spray, aerosol, or oil. Alternatively, a formulation may comprise a patch or a dressing such as a bandage or adhesive plaster impregnated with active compounds and optionally one or more excipients or diluents.

20 Formulations suitable for topical administration in the mouth include lozenges comprising the active compound in a flavored basis, usually sucrose and acacia or tragacanth; pastilles comprising the active compound in an inert basis such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the

25 active compound in a suitable liquid carrier.

Formulations suitable for topical administration to the eye also include eye drops wherein the active compound is dissolved or suspended in a suitable carrier, especially an aqueous solvent for the active compound.

30 Formulations suitable for nasal administration, wherein the carrier is a solid, include a coarse powder having a particle size, for example, in the range of about 20 to about 500 microns which is administered in the manner in which snuff is taken, i.e.,

- 72 -

by rapid inhalation through the nasal passage from a container of the powder held close up to the nose. Suitable formulations wherein the carrier is a liquid for administration as, for example, nasal spray, nasal drops, or by aerosol administration by nebuliser, include aqueous or oily solutions of the active
5 compound.

Formulations suitable for topical administration via the skin include ointments, creams, and emulsions. When formulated in an ointment, the active compound may optionally be employed with either a paraffinic or a water-miscible ointment
10 base. Alternatively, the active compounds may be formulated in a cream with an oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example, at least about 30% w/w of a polyhydric alcohol, i.e., an alcohol having two or more hydroxyl groups such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol and polyethylene glycol and mixtures thereof. The
15 topical formulations may desirably include a compound which enhances absorption or penetration of the active compound through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogues.

20 When formulated as a topical emulsion, the oily phase may optionally comprise merely an emulsifier (otherwise known as an emulgent), or it may comprises a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabiliser. It is also preferred to include both an oil and a fat.
25 Together, the emulsifier(s) with or without stabiliser(s) make up the so-called emulsifying wax, and the wax together with the oil and/or fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations.

30 Suitable emulgents and emulsion stabilisers include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol, glyceryl monostearate and sodium lauryl sulphate. The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties, since the solubility of the active

- 73 -

compound in most oils likely to be used in pharmaceutical emulsion formulations may be very low. Thus the cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters known as Crodamol CAP may be used, the last three being preferred esters. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils can be used.

Formulations suitable for rectal administration may be presented as a suppository with a suitable base comprising, for example, cocoa butter or a salicylate.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active compound, such carriers as are known in the art to be appropriate.

Formulations suitable for parenteral administration (e.g., by injection, including cutaneous, subcutaneous, intramuscular, intravenous and intradermal), include aqueous and non-aqueous isotonic, pyrogen-free, sterile injection solutions which may contain anti-oxidants, buffers, preservatives, stabilisers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents, and liposomes or other microparticulate systems which are designed to target the compound to blood components or one or more organs. Examples of suitable isotonic vehicles for use in such formulations include Sodium Chloride Injection, Ringer's Solution, or Lactated Ringer's Injection.

Typically, the concentration of the active compound in the solution is from about 1 ng/ml to about 10 µg/ml, for example from about 10 ng/ml to about 1 µg/ml. The formulations may be presented in unit-dose or multi-dose sealed containers, for example, ampoules and vials, and may be stored in a freeze-dried (lyophilised)

- 74 -

condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules, and tablets.

Formulations may be in the form of liposomes or other microparticulate systems
5 which are designed to target the active compound to blood components or one or more organs.

Dosage

10 It will be appreciated that appropriate dosages of the active compounds, and compositions comprising the active compounds, can vary from patient to patient. Determining the optimal dosage will generally involve the balancing of the level of therapeutic benefit against any risk or deleterious side effects of the treatments of the present invention. The selected dosage level will depend on a variety of factors
15 including, but not limited to, the activity of the particular compound, the route of administration, the time of administration, the rate of excretion of the compound, the duration of the treatment, other drugs, compounds, and/or materials used in combination, and the age, sex, weight, condition, general health, and prior medical history of the patient. The amount of compound and route of administration will
20 ultimately be at the discretion of the physician, although generally the dosage will be to achieve local concentrations at the site of action which achieve the desired effect.

Administration *in vivo* can be effected in one dose, continuously or intermittently
25 throughout the course of treatment. Methods of determining the most effective means and dosage of administration are well known to those of skill in the art and will vary with the formulation used for therapy, the purpose of the therapy, the target cell being treated, and the subject being treated. Single or multiple administrations can be carried out with the dose level and pattern being selected by
30 the treating physician.

In general, a suitable dose of the active compound is in the range of about 0.1 to about 250 mg per kilogram body weight of the subject per day. Where the active

- 75 -

compound is a salt, an ester, prodrug, or the like, the amount administered is calculated on the basis of the parent compound and so the actual weight to be used is increased proportionately.

EXAMPLES

The following examples are provided solely to illustrate the present invention and are not intended to limit the scope of the invention, as described herein.

10 General Procedures

Melting points (mp) were recorded on a Leica Galen III hot-stage melting point apparatus and are uncorrected. ¹H-NMR spectra were recorded at 250 MHz on a Bruker AC250 spectrometer in either d₆-Me₂SO or CDCl₃ solution at 303±1 K using Me₄Si (TMS) as internal standard. EI (70 eV), FAB and high resolution accurate mass spectra were determined by The School of Pharmacy (University of London, UK). Elemental analyses were carried out by Medac Ltd. (Brunel Science Center, Egham, Surrey, UK); results for elements indicated by symbols were within 0.4% of theoretical values. TLC was carried out on silica gel (Merck 60F-254) using CHCl₃/MeOH (0-20% MeOH) as eluent, with visualization at 254 and 366 nm. Organic solutions were dried over sodium sulphate.

- A mixture of 2-chloro-5-nitrobenzoic acid **9** (150 g, 0.744 mol), 1,4-phenylenediamine **8** (150.0 g, 1.387 mol), anhydrous potassium carbonate (309 g, 2.236 mol), copper powder (2.0 g, 31.5 mol), cupric sulfate (10 mg) and water (2.25 l) was heated to reflux with stirring for 5 hr. It was then filtered hot through a fluted paper and allowed to stand overnight at room temperature. The potassium salt of the product was collected on a glass sinter and washed with ice-cold water (2 x 250 mL) followed by ice-cold ethanol (250 mL). The product was dissolved in boiling water (1250mL) and acetic acid was then added until there was no further precipitation. The mixture was cooled with an external ice water bath and the product collected. The product was washed with ice-cold water (3 x 500 mL) followed by ice-cold ethanol (2 x 500 mL), dry ether (250 mL) and finally hexane (2 x 500 mL). the steam bath was continued for 6 hr, the mixture being stirred occasionally.
10 Whilst still hot, the mixture was poured into 4 L of ice-water, stirred for 30 min, and
allowed to stand overnight. The mixture was adjusted to pH 8.0 by the addition of

15 dry ether (2 x 250 mL) and finally hexane (250 mL). The product, **11**, was dried

Biological DataTaq Polymerase Assay

- 5 All compounds were tested using a *Taq* assay to eliminate broad-spectrum polymerase inhibitors and thus filter out any false positives which might have occurred in the TRAP assay. Thus, preferred compounds are "*Taq*-negative." Compounds were tested as their acid addition salts at various final concentrations (0.1, 0.5, 1, 5, 10, 20 and 50 μ M) in a PCR 50 μ L master mix containing 10 ng
- 10 pCI-neo mammalian expression vector (Promega, Southampton, UK) and forward (GGAGTTCCGCGTTACATAAC) and reverse (GTCTGCTCGAAGCATTAACC) primers (200 nmol) as described in the art (see, e.g., Perry et al., 1998a). The product of approximately 1 kb was visualized on a 2% w/w agarose gel following amplification (30 cycles of 94°C for 1 min, 55°C for 1 min and 72°C for 2.5 min).
- 15 The *Taq* assay was carried out until no *Taq* polymerase inhibition was observed. All compounds were found to be *Taq* negative.

Modified Telomeric Repeat Amplification Protocol (TRAP) Assay

- 20 The ability of compounds to inhibit telomerase in a cell-free assay was assessed with a modified TRAP assay using extracts from exponentially growing A2780 human ovarian carcinoma cells. The TRAP assay was performed in 2 steps:
- (a) telomerase-mediated extension of the forward primer (TS: 5'-AATCCGTCGAGCAGAGTT, Oswel Ltd., Southampton, UK) contained in a
- 25 40 μ L reaction mix comprising TRAP buffer (20 mM Tris-HCl (pH 8.3), 68 mM KCl, 1.5 mM $MgCl_2$, 1 mM EGTA, 0.05% v/v Tween 20), 0.05 μ g bovine serum albumin, 50 μ M of each deoxynucleotide triphosphate, 0.1 μ g TS primer, and 3 μ Ci of [α -³²P]dCTP (Amersham plc, UK). Protein (40 ng or 20 ng) was then incubated with the reaction mix + agent (acid addition and quaternary dimethiodide salts) at
- 30 final concentrations of up to 50 μ M for 20 min at 25°C. A lysis buffer (no protein) control, heat-inactivated protein control, and 50% protein (20 ng or 10 ng) control were included in each assay; and (b) while heating at 80°C in a PCR block of a thermal cycler (Hybaid, UK) for 5 min to inactivate telomerase activity, 0.1 μ g of

- 144 -

reverse CX primer (3'-AATCCCATTCCCATTCCCATTCCC-5') and 2 Units of *Taq* DNA polymerase ("red hot", Advanced Biotechnologies) were added. A 3-step PCR was then performed: 94°C for 30 s, 50°C for 30 s, and 72°C for 1 min for 31 cycles. Telomerase-extended PCR products in the presence or absence of

5 compounds were then determined either by electrophoretic separation using 8% w/w acrylamide denaturing gels and analysis by phosphorimaging or autoradiography, or by harvesting on Whatman filters (25 mm glass microfibre) and analysis by liquid scintillation counting. The data are summarized in Table 1.

10 Growth Inhibition Assay

Growth inhibition was measured in three human ovarian carcinoma cell lines (A2780, CH1, and SKOV-3) and one human cervix carcinoma cell line (A431) using the sulforhodamine B (SRB) assay. Briefly, between 3000 and 6000 cells were

15 seeded into the wells of 96-well microtiter plates and allowed to attach overnight. Compounds (acid addition and quaternary dimethiodide salts) were dissolved at 500 µM in water and immediately added to wells in quadruplicate at final concentrations of 0.05, 0.25, 1, 5 and 25 µM. Following an incubation period of 96 hr, remaining cells were fixed with ice-cold 10% w/v trichloroacetic acid (30 min)

20 and stained with 0.4% SRB in 1% v/v acetic acid (15 min). Mean absorbance at 540 nm for each drug concentration was expressed as a percentage of the control untreated well absorbance, and IC₅₀ values (concentration required to inhibit cell growth by 50%) were determined for each agent. The data are summarized in Table 1.

(54) Title: **THERAPEUTIC ACRIDONE AND ACRIDINE COMPOUNDS**

(57) Abstract: The present invention pertains to acridone and acridine compounds of formula (I), wherein either: (a) K is =O, L is -H, alpha is a single bond, beta is a double bond, gamma is a single bond (acridones); or, (b) K is a 9-substituent, L is absent, alpha is a double bond, beta is a single bond, gamma is a double bond (acridines); and wherein: J¹ is a 2- or 3-substituent; J² is a 6- or 7-substituent; J¹ and J² are each independently a group of the formula -NHCO(CH₂)_nNR¹R², wherein: n is an integer from 1 to 5; and, R¹ and R² are independently hydrogen, C₁₋₇alkyl, C₃₋₂₀heterocyclyl, or C₅₋₂₀aryl, or R¹ and R², taken together with the nitrogen atom to which they are attached, form a heterocyclic ring having from 3 to 8 ring atoms; and wherein, when K is a 9-substituent, K is a group of the formula -N(R^N)Q, wherein: R^N is an amino substituent and is hydrogen, C₁₋₇alkyl, C₃₋₂₀heterocyclyl, or C₅₋₂₀aryl; and, Q is C₁₋₇alkyl, C₃₋₂₀heterocyclyl, or C₅₋₂₀aryl, and is optionally substituted; and pharmaceutically acceptable salts, esters, amides, solvates, hydrates, and protected forms thereof. The present invention also pertains to pharmaceutical compositions comprising such compounds, and the use of such compounds and compositions, both *in vitro* and *in vivo*, to inhibit telomerase, to regulate cell proliferation, and in the treatment of proliferative conditions, such as cancer.
